Secured Chat

Secured Chat

Chat rooms are online spaces where users can communicate with one another through text-based messages. The security element in chat room applications is important to ensure all message from users are protected from others. So, we need to provide some method to manage the security problem.

Cryptography (Encrypt-Decrypt)

Cryptography is an important method to keep private data security in order to unauthorized access. In this project, We are working on the data encryption.

The architecture of the chat room application is divided into two parts. First is sender and second is receiver. This communication is connected via internet. In sender part, the sender is needed to enter a message using chat room interface. After that, the message will encrypt using encryption algorithm. Then, the message will send to receiver. In receiver part, decryption process will occur. The purpose of this decryption is to convert cipher text to plaintext.

In PKC Every user has a pair of keys which were related :

- Public key : known to everyone in the system with assurance
- Private key : known only by its owner

Protocol

1. Connect both computer to the server.
2. Sender and Receiver agrees on a key.
3. Receiver sends his public key to Sender.
4. Sender encrypts the message with the receiver's public key and sends the ciphertext back.
5. Receiver decrypts the ciphertext using his private key.

Facts

- Application is written in JAVA
- Chat implementation utilizes Socket IO (websocket + chat rooms)
- Divided into two sides. (Server : Client)
- Written using Eclipse program

Function

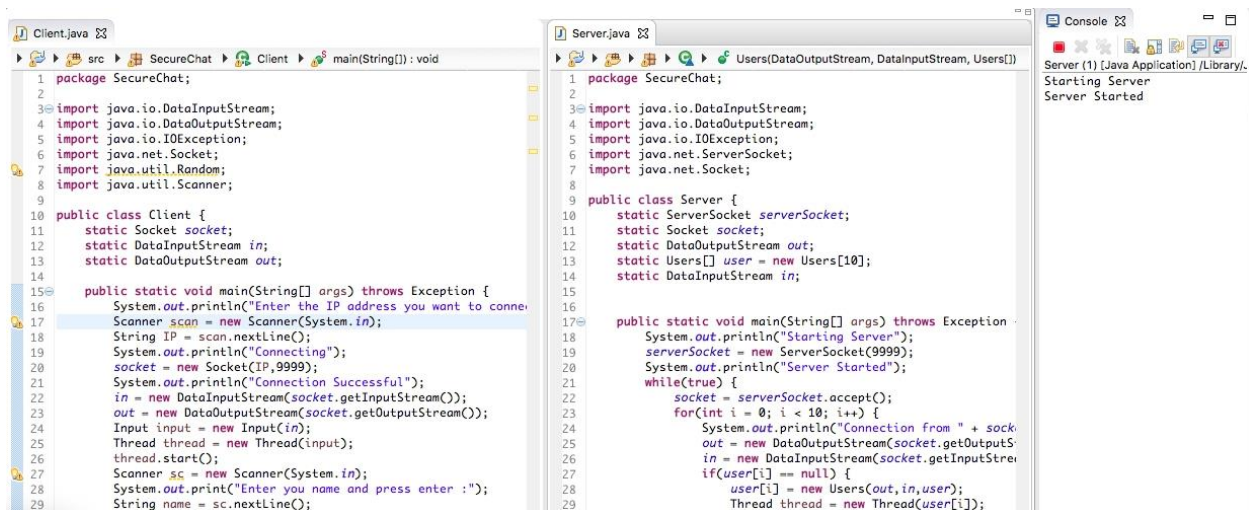

Server class :
Main, Users, Run()

Client class :
Main, EncryptMessage, ChangeKey, Run(), DecryptMessage, ChangeDecrypt

Steps that are implemented for encryption

1. Define the logistic equation
2. Define sites for characters and vowels
3. Set the secret key

Start the application by running the console web-based program. Connect to the server.

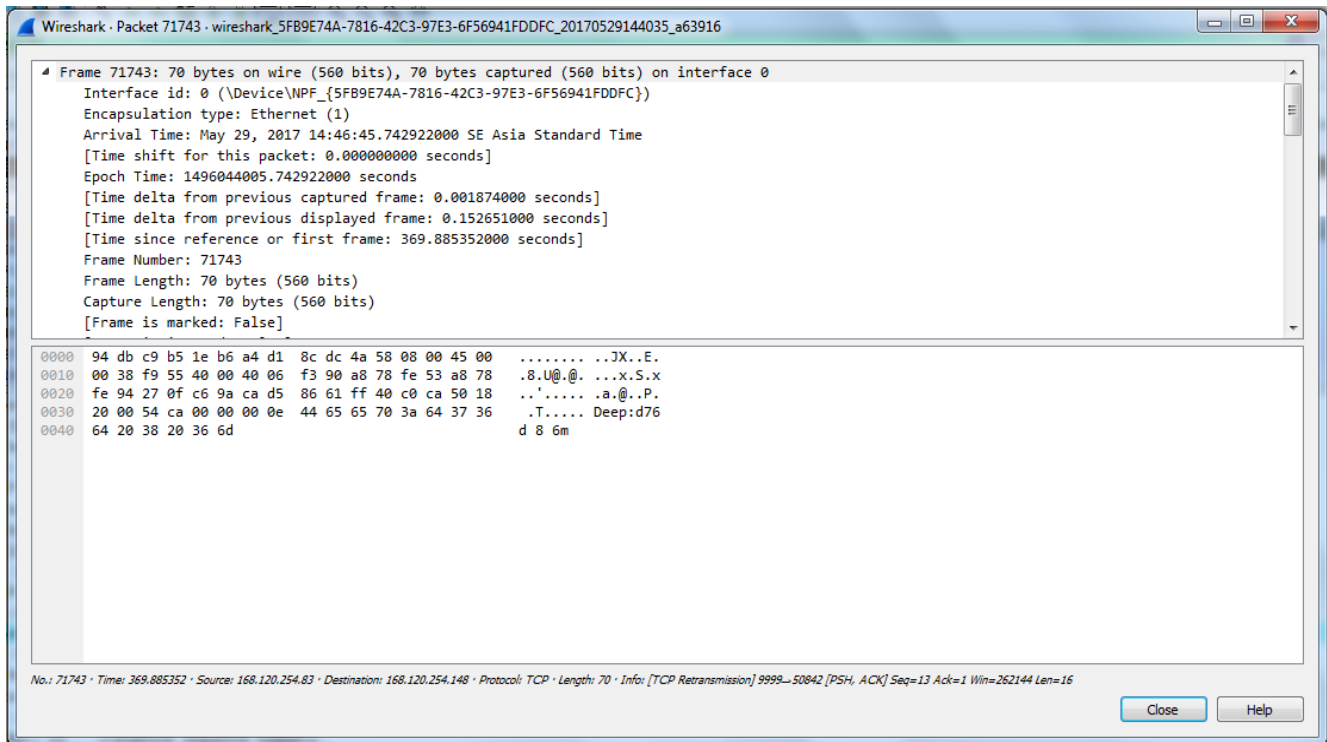

```
Client.java
1 package SecureChat;
2
3 import java.io.DataInputStream;
4 import java.io.DataOutputStream;
5 import java.io.IOException;
6 import java.net.Socket;
7 import java.util.Random;
8 import java.util.Scanner;
9
10 public class Client {
11     static Socket socket;
12     static DataInputStream in;
13     static DataOutputStream out;
14
15     public static void main(String[] args) throws Exception {
16         System.out.println("Enter the IP address you want to connect");
17         Scanner scan = new Scanner(System.in);
18         String IP = scan.nextLine();
19         System.out.println("Connecting");
20         socket = new Socket(IP, 9999);
21         System.out.println("Connection Successful");
22         in = new DataInputStream(socket.getInputStream());
23         out = new DataOutputStream(socket.getOutputStream());
24         Input input = new Input(in);
25         Thread thread = new Thread(input);
26         thread.start();
27         Scanner sc = new Scanner(System.in);
28         System.out.print("Enter your name and press enter :");
29         String name = sc.nextLine();
    }
}

Server.java
1 package SecureChat;
2
3 import java.io.DataInputStream;
4 import java.io.DataOutputStream;
5 import java.io.IOException;
6 import java.net.ServerSocket;
7 import java.net.Socket;
8
9 public class Server {
10     static ServerSocket serverSocket;
11     static Socket socket;
12     static DataOutputStream out;
13     static Users[] user = new Users[10];
14     static DataInputStream in;
15
16
17     public static void main(String[] args) throws Exception {
18         System.out.println("Starting Server");
19         serverSocket = new ServerSocket(9999);
20         System.out.println("Server Started");
21         while(true) {
22             socket = serverSocket.accept();
23             for(int i = 0; i < 10; i++) {
24                 System.out.println("Connection from " + socket);
25                 out = new DataOutputStream(socket.getOutputStream());
26                 in = new DataInputStream(socket.getInputStream());
27                 if(user[i] == null) {
28                     user[i] = new Users(out, in, user);
29                     Thread thread = new Thread(user[i]);
    }
    }
}

Console
Server (1) [Java Application] /Library/
Starting Server
Server Started
```

Encrypt data at one end using the key, send it over the servers, and at the other end it can be read because the key is known.

The figure above show the message that has been sent from Deep. Once it's connected and sent out, It gets encrypt. The message has been converted to the other form and send over the network. (Last line)
