TOPIC

Leetcode 881.
Boats to Save People

Difficulty : **Medium**

Problem

You are given an array `people` where `people[i]` is the weight of the i^{th} person, and an infinite number of boats where each boat can carry a maximum weight of `limit`. Each boat carries at most two people at the same time, provided the sum of the weight of those people is at most `limit`.

****Return the minimum number of boats to carry every given person.****

Given Example

✓ Example 1

Example 1:

```
Input: people = [1,2], limit = 3  
Output: 1  
Explanation: 1 boat (1, 2)
```

Person 1 and 2's weight added together doesn't go over limit which is 3. So the minimum boat is 1

✓ Example 2

Example 2:

```
Input: people = [3,2,2,1], limit = 3  
Output: 3  
Explanation: 3 boats (1, 2), (2) and (3)
```

Only person weight 2 and 1 add together doesn't go over 3 (limit). So there will be 3 boats as other two person will get their own boats

✓ Example 3

Example 3:

```
Input: people = [3,5,3,4], limit = 5  
Output: 4  
Explanation: 4 boats (3), (3), (4), (5)
```

There is no weights from input that is added together and doesn't go over 5 (limit). So, each person will get their own boats which the answer is 4

Analysis 1

What problem state?

01

Given Variable

- Array of people weight
- Limit weight of one boat

02

Limitation

- One boat cannot carry more than 2 people at the same time
- 2 people weight added together must not exceed Limit weight

Analysis 2

What should we do?

01

- The lightest person will go with the heaviest person.
- Or lightest person go with who have heavier weight but not heaviest.

02

- Add their weight added together
- It must not exceed the limit.

03

If that is not possible, then the heaviest person will get their own boat.

```
def Boats2(people, limit) :  
    people.sort()  
    light = 0 #First Index  
    heavy = len(people) - 1 #Last index  
    boats = 0  
  
    while light < heavy :  
        if(people[light] + people[heavy]) <= limit :  
            people[light] = 0  
            people[heavy] = 0  
            light += 1  
            heavy -= 1  
            boats += 1  
        else:  
            heavy -= 1  
    for i in range(len(people)):  
        if(people[i]!= 0):  
            boats += 1  
    return boats
```

Variable initiation and array sorting

Match lightest and heaviest

Heavy person get their own boat

[Yellow box]

First Approach

- People = 0 in order to count any leftover person with weight that cannot go with anyone (Calculation done in for loop)

First Approach Submission

Runtime = 460 ms, Memory = 19.6 MB

Success [Details >](#)

Runtime: **460 ms**, faster than **50.97%** of Python3 online submissions for Boats to Save People.

Memory Usage: **19.6 MB**, less than **97.56%** of Python3 online submissions for Boats to Save People.

Time Submitted	Status	Runtime	Memory	Language
09/21/2021 20:30	Accepted	460 ms	19.6 MB	python3

Reduce Runtime

```
def Boats2(people, limit) :
    people.sort()
    light = 0 #First Index
    heavy = len(people) - 1 #Last index
    boats = 0

    while light < heavy :
        if(people[light] + people[heavy]) <= limit :
            people[light] = 0
            people[heavy] = 0
            light += 1
            heavy -= 1
            boats += 1
        else:
            heavy -= 1
    for i in range(len(people)):
        if(people[i] != 0):
            boats += 1
    return boats
```

Making changes

- Changing `light < heavy` to `light <= heavy` to calculate the last person as well
- delete else statement and move indent of `heavy -= 1` and `boats += 1`
- delete the for loop

```
def Boats(people, limit) :  
    people.sort()  
    light = 0 #First Index  
    heavy = len(people) - 1 #Last index  
    boats = 0  
  
    while(light <= heavy) :  
        if(people[light] + people[heavy]) <= limit:  
            light = light + 1  
        heavy -= 1  
        boats += 1  
    return boats
```

Variable initiation
and array sorting

Boats Calculation

Second Approach

If the heaviest person add with lightest person is greater than the limit, their get their own boat, and the index move down to second heaviest.
(The weight are sorted in ascending order)

Second Approach Submission

Runtime = 448 ms, Memory = 20.9 MB

Success [Details >](#)

Runtime: **448 ms**, faster than **72.09%** of Python3 online submissions for Boats to Save People.

Memory Usage: **20.9 MB**, less than **93.00%** of Python3 online submissions for Boats to Save People.

Time Submitted	Status	Runtime	Memory	Language
09/22/2021 11:32	Accepted	448 ms	20.9 MB	python3

THANK YOU!
